

Software Design and Engineering

Lab Document

High Level Purpose Statement:	I want to figure out how to use Spring Boot to create and use a server for a java project.
Experimental Design:	The software is a very basic test of how to use the postmapping and getmapping features
Resources Available:	Documentation on Spring Boot's website showed me how to get the server up and running.
Time Estimate:	I spent a about an hour working on getting the server set up.
Experiment Notes:	Spring Boot has a lot of functionality for running a server and looks to be an invaluable tool for future server/client architecture use.
Results:	I have been able to add strings to a list from the browser and view the list from the browser as well.
Consequences for the Future:	I could definitely see myself using Spring Boot in the future.
